

Python for Linguists 2023

Quiz for week 7

Name: _____

Write code to define two functions:

1. `print_list_reverse` should take a list of strings as argument and **print** all its elements from last to first, each on a separate line.

Example: `print_list_reverse(['Ann', 'Bob', 'Chris'])` should print `Chris`, then `Bob`, then `Ann`, each on a new line.

2. `initials_to_string` should take a list of strings as argument, and **return** a single string composed of all the initials.

Example: `initials_to_string(['Ann', 'Bob', 'Chris'])` should evaluate to the string `'ABC'`.

TODO: Include some `join`/`strip`/whatever operation too.
