

## Python for Linguists 2023

### Quiz for week 7

Name: \_\_\_\_\_

Write a function `analyze_strings` that takes a list of strings and prints some statistics:

- The total number of strings in the list (elements of the list).
- The length, and number of vowels, of each *individual* string.
- The *total* length and *total* number of vowels of all strings taken together.

You are free to do this in a single, self-contained function, or to define auxiliary functions.
